Aim

To create an interactive retail sales dashboard using Microsoft Power BI to analyze sales, profit, product categories, monthly sales trends, and regional performance through charts, tables, KPI cards, and slicers.

Description

Microsoft Power BI is a business intelligence and data visualization tool used to transform raw data into meaningful insights. In this experiment, a retail sales dataset is imported into Power BI and prepared using Power Query. DAX measures are created to calculate total sales, total profit, total orders, total quantity, and profit margin.

Various visualizations, including bar charts, line charts, pie charts, KPI cards, and tables, are created to analyze sales performance. Interactive slicers are added to filter the data by region, category, and date. Finally, all visualizations are arranged into an interactive dashboard for effective analysis and decision-making.

Observation

1. KPI cards display total sales, total profit, and total orders.
2. Bar charts compare sales across different product categories.
3. Line charts show monthly sales trends.
4. Pie charts represent the contribution of each category to total sales.
5. Slicers allow users to filter data by region, category, and date.
6. The dashboard provides a clear and interactive overview of retail sales performance.

Result

An interactive retail sales dashboard was successfully created using Microsoft Power BI to analyze sales performance, profitability, category-wise contributions, and monthly trends.
